

EBU5608 Product Development and Management

Topic 9 – System Level Design

©Bing Han 2024

1

Agenda

- ❑ Aim of Phase 2 System-level Design
- ❑ Product architecture – what is it?
- ❑ Modular and integral architecture
- ❑ Implications of product architecture
- ❑ Role of the product architecture team
- ❑ **4-step method** for establishing the product architecture
- ❑ Key outcomes

EBU5608

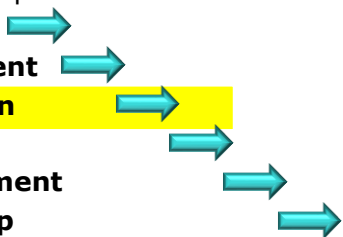

2

2

The product development process

- Product development **starts** with planning and **concludes** with product launch
- A generic product development process can be used as an example
- The process has six distinct phases
 - 0. **Planning**
 - 1. **Concept development**
 - 2. **System-level design**
 - 3. **Detail design**
 - 4. **Testing and refinement**
 - 5. **Production ramp-up**

EBU5608

3

3

Phase 2 – System-level design

- During phase 2, the development of the **architecture** of the product continues from phase 1 - concept development
 - i.e. the **product specifications** identified in the Contract Book continue to become more **defined**
- Phase 2 includes the definition of the **product architecture** and the **decomposition** into functional & physical **elements**

EBU5608

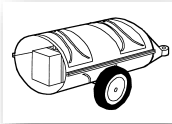

4

4

Phase 2 – System-level design

- This definition and decomposition can be clearer for **physical** products, but still relevant for **software** etc
 - Think about the use of classes, subsystems and interfaces in **Java** program development, for example

EBU5608

5

Product Architecture

- **Product Architecture** can be described as:
 - “the **scheme** by which the **functional elements** of the product are **arranged** into **physical chunks** and by which the **chunks interact**”
 - **Functional** – individual **operations** and **transformations** that contribute to its **overall** performance
 - **Physical** – **parts, components** and **subassemblies** that implement the product’s functions

EBU5608

6

Product Architecture's Aim

- Architectural decisions allow the **detailed design** and **testing** of these physical blocks to be assigned to **teams**, individuals, and/or suppliers, so that the development of different portions can be carried out **simultaneously**

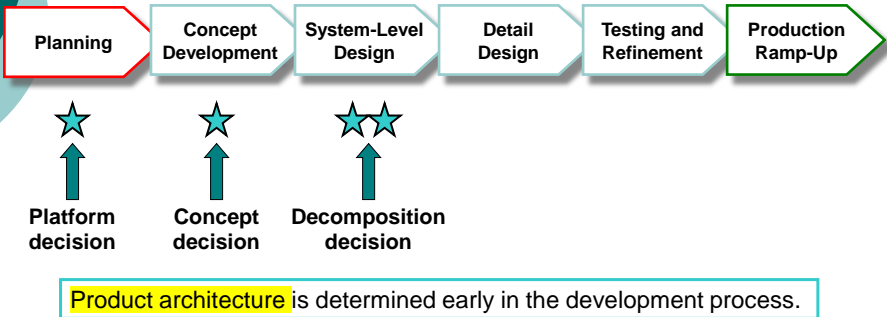

EBU56087

7

...in a Product Development Process

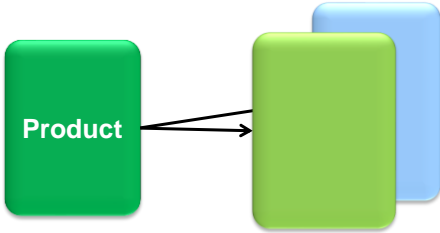

EBU56088

8

Product Architecture - Chunks

- The physical elements of a product are typically organised into several major building blocks – called **chunks**
- These chunks become the building blocks for the product or **family** of products

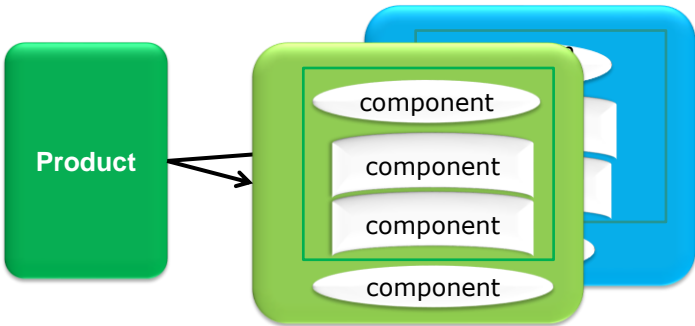

EBU5608

9

Product Architecture - Chunks

- Each chunk is then made up of a collection of **components** which implement the **functions** of the product

EBU5608

10

Product Architecture - Chunks

- The **architecture** of a product is therefore the **scheme** by which the **functional elements of the product are**
 - arranged** into **physical chunks** and
 - by which the **chunks interact**

EBU5608

11

Modular or Integral Architecture?

iPhone

Rollerblade
In-Line Skates

Tesla
car

EBU5608

12

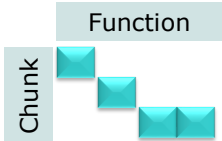

Modular & integral architecture

- A **key characteristic** of product architecture is the degree to which it is either:
 - **Modular**, in which
 - Each chunk implements **one** or a **few functions entirely**.
 - The **interactions** between chunks are **well defined**.
 - Modular architecture has **simplicity** and **reusability** for a product family or platform.

Function

Chunk

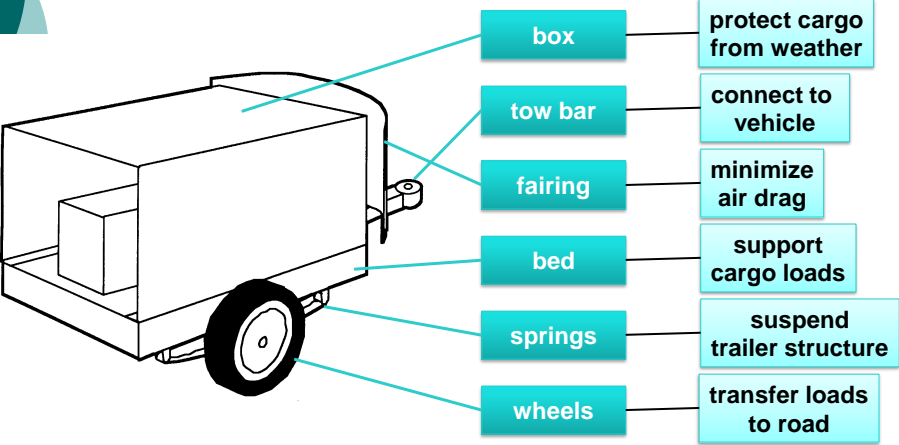

EBU560813

13

Trailer example: Modular Architecture

box	protect cargo from weather
tow bar	connect to vehicle
fairing	minimize air drag
bed	support cargo loads
springs	suspend trailer structure
wheels	transfer loads to road

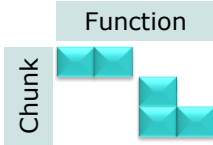

EBU560814

14

Modular & integral architecture

- **Integral**
 - **Functional elements** are implemented by **multiple** chunks, or a chunk may implement many functions
 - The **interactions** between chunks are **poorly defined**
 - Integral architecture generally increases performance and reduces costs for any specific product model.

EBU5608

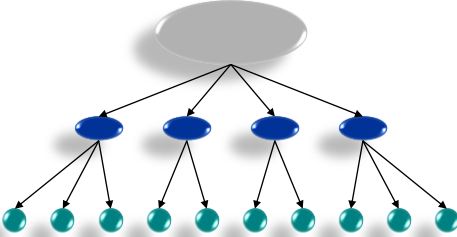

15

15

Concepts and levels

- The concepts of integral and modular apply at several levels:
 - System
 - Sub-system
 - Component

EBU5608

16

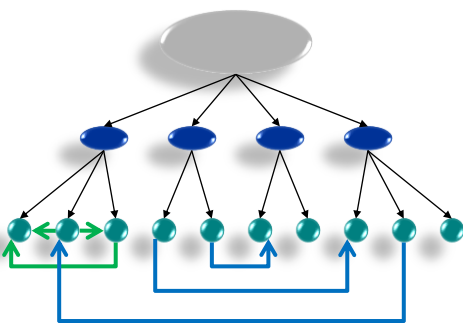

16

Queen Mary
University of London

Decomposition & interactions

- Product Architecture is decomposition + interactions
- Decomposition
- Interactions
 - within chunks
 - across chunks

EBU5608 17

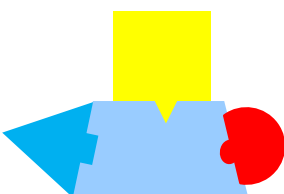

17

Queen Mary
University of London

Modular architecture

- There are three main types of modular architecture:
 - Slot-modular** (the most common type)
 - Each of the **interfaces** between chunks in a slot-modular architecture is of a **different type** from the others – therefore the various **chunks** in the product **cannot** be interchanged

EBU5608 18

18

Modular architecture

- There are three types of modular architecture:
 - Bus-modular**
 - There is a **common bus** to which the other chunks connect via the **same type** of interface

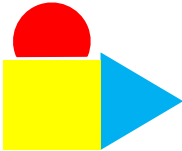

EBU5608

19

Modular architecture

- There are three types of modular architecture:
 - Sectional-modular**
 - All **interfaces** are of the **same type**, there is **no single element** to which all the other chunks **attach**
 - The assembly is built up by connecting the chunks to **each other** via identical interfaces

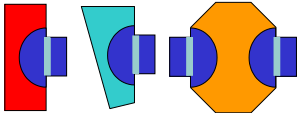

EBU5608

20

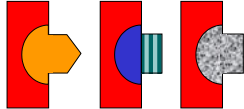

Queen Mary
University of London

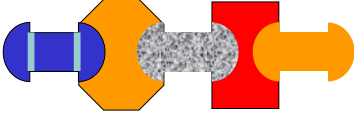

Other Types of Modularity

Slot Modularity

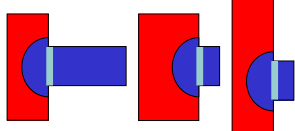

Sharing Modularity

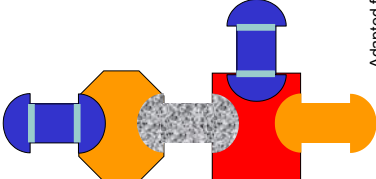

Sectional Modularity

Bus Modularity

Fabricate-to-Fit Modularity

Mix Modularity

Adapted from K. Ulrich, "The Role of Product Architecture in the Manufacturing Firm", Research Policy, 1995.

Trailer example: Integral Architecture

Here we show a similar example to the modular architecture trailer, but the parts are now integral to each other – in many cases

One chunk can perform **many functions** – and **one function** can need **many chunks**

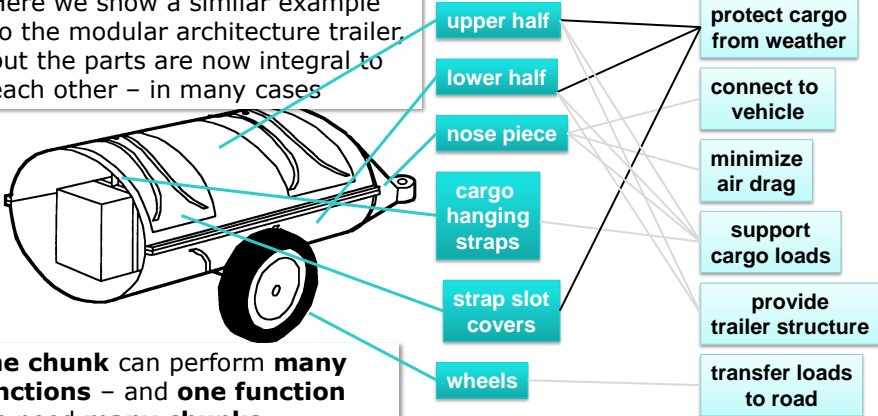

EBU5608

22

Trailer example: Integral Architecture

EBU560825

25

Implications of product architecture

- There are **implications** to the decisions you make about product architecture
- Product change**
 - Modular** chunks allow **changes** to be made to a **few isolated** functional elements of the product without necessarily affecting the design of **other chunks**
 - Motives** for change include – upgrades, add-ons, adaptation, wear, consumption, flexibility in use, reuse

EBU560826

26

Implications of product architecture (cont.)

- **Product variety**
 - Variety refers to the **range** of product models the firm can produce within a particular **time** period in response to market **demand**
 - Products built around **modular** product architectures can be **more easily varied** without adding tremendous complexity to the **manufacturing** system
 - e.g. mobile phone handset design, portable audio

EBU5608

27

27

Implications of product architecture – product variety example

- Sony is a major consumer and commercial electronics manufacturer
- Sony sells **54 models** of portable audio equipment in the UK, including
 - MP3
 - Personal CD, minidisc & tape
 - Portable CD+radio
 - Portable radio
- Uses **modular architecture** and **flexible manufacturing** techniques to
 - Introduce new **models**
 - Meet changes in **demand**

EBU5608

28

28

Implications of product architecture (cont.)

- **Component standardisation**
 - The use of the **same** component or chunk in **multiple** products
 - If a chunk implements only one or a few **widely useful** functional elements, then the chunk can be **standardised** and used in several **different** products
 - Example – standard batteries

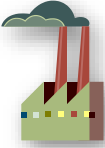

EBU560829

29

Implications of product architecture (cont.)

- **Product performance**
 - How **well** a product implements its intended **functions**
 - Product performance **characteristics** include speed, efficiency, life, accuracy and noise
- **Manufacturability**
 - The product architecture also directly affects the ability of the team to design each chunk to be **produced** at **low cost**

EBU560830

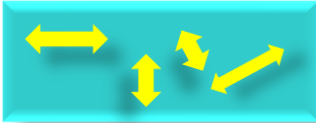

30

Implications of product architecture (cont.)

Mentimeter

- Product development management
 - Responsibility for the detail design of each chunk is usually assigned to a relatively **small group** within the **firm** or to an outside **supplier**
 - Chunks are assigned to a single individual or group because their design requires careful resolution of **interactions** among components within the chunk

EBU5608

31

31

Role of Product Architecture Team

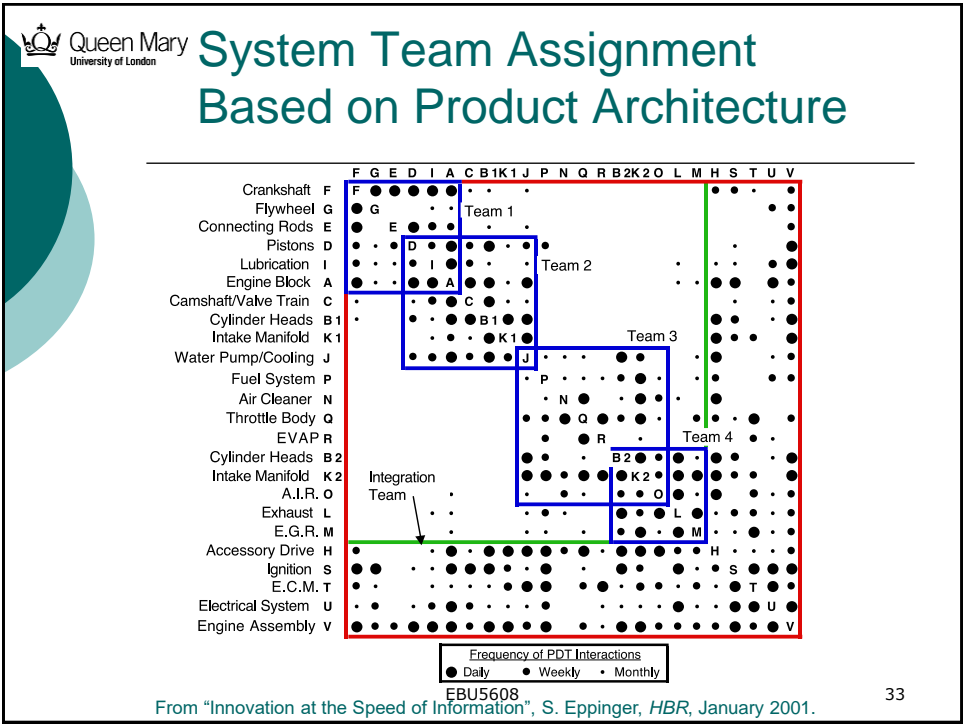

- The architecture should be established by a **cross-functional** effort by the development team as it will have implications for
 - subsequent product **development** activities, and
 - the **manufacturing** and **marketing** of the completed product

EBU5608

32

32

Summary

- The **architecture** of a product is therefore the **scheme** by which the **functional elements of the product** are arranged into **physical chunks** and by which the **chunks interact**.
- Two main types of architecture
 - **Modular** (slot, bus, sectional) in which each chunk implements **one** or a **few functions entirely** and the **interactions** between chunks are **well defined**.
 - **Integral**, in which **functional elements** are implemented by **multiple** chunks, or a chunk may implement many functions, and the **interactions** between chunks are **poorly defined**.
- Implications of product architecture: product **change**, **variety**, **performance**, **manufacturability**, **components standardisation**, **product development management**

EBU5608

34

The 4 step method

- Ulrich and Eppinger recommend a **4-step method** for establishing the product architecture
 - Step 1 – Create a **schematic** of the product
 - Step 2 – **Cluster** the elements of the schematic
 - Step 3 - Create a rough **geometric layout**
 - Step 4 – Identify the fundamental and incidental **interactions**

EBU5608

35

35

Product Architecture Example: Hewlett-Packard DeskJet Printer

EBU5608

36

36

Step 1 – Create a schematic of the product

- A schematic is a diagram representing the team's understanding of the **component elements** of the product
 - An example can be seen in a later slide
- At the **end** of **Phase 1** – Concept Development
 - some of the **elements** in the schematic are **physical** concepts
 - some correspond to **critical components**
 - but some are still only described **functionally**

EBU5608 37

37

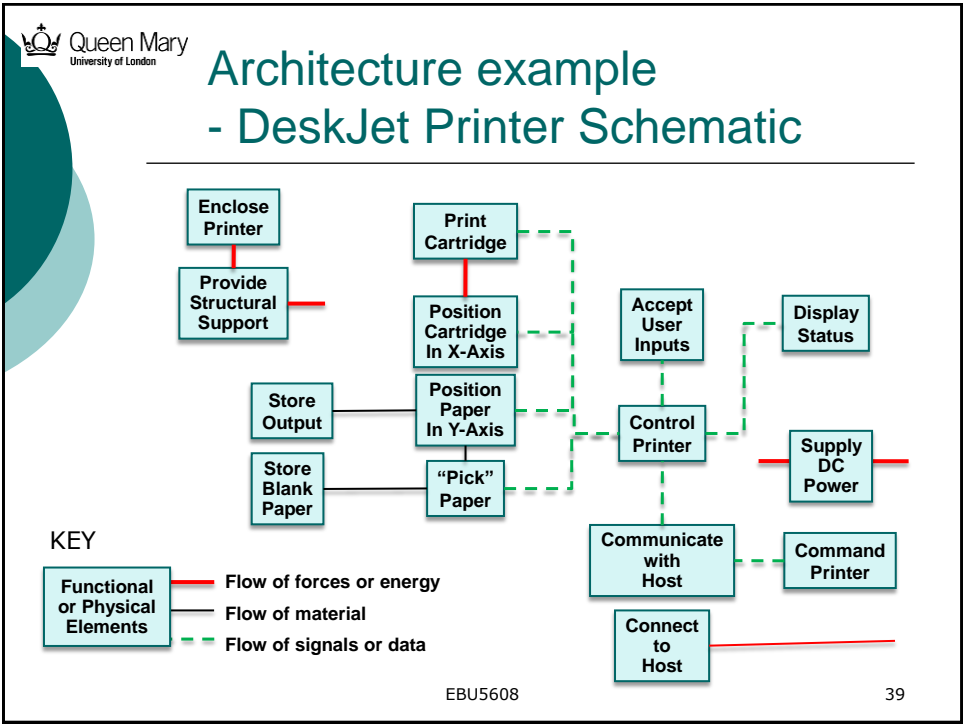

Step 1 – Create a schematic of the product

- The schematic should reflect the **best understanding** of the state of the product, it does not have to contain every detail
- More **detailed** functional elements are finalised **later** in Phase 2
- A good **guideline** is for there to be **no more than 30 elements** in the schematic
- Usually **more than one** alternative schematic is developed and the team spend time **selecting** the most appropriate

EBU5608 38

38

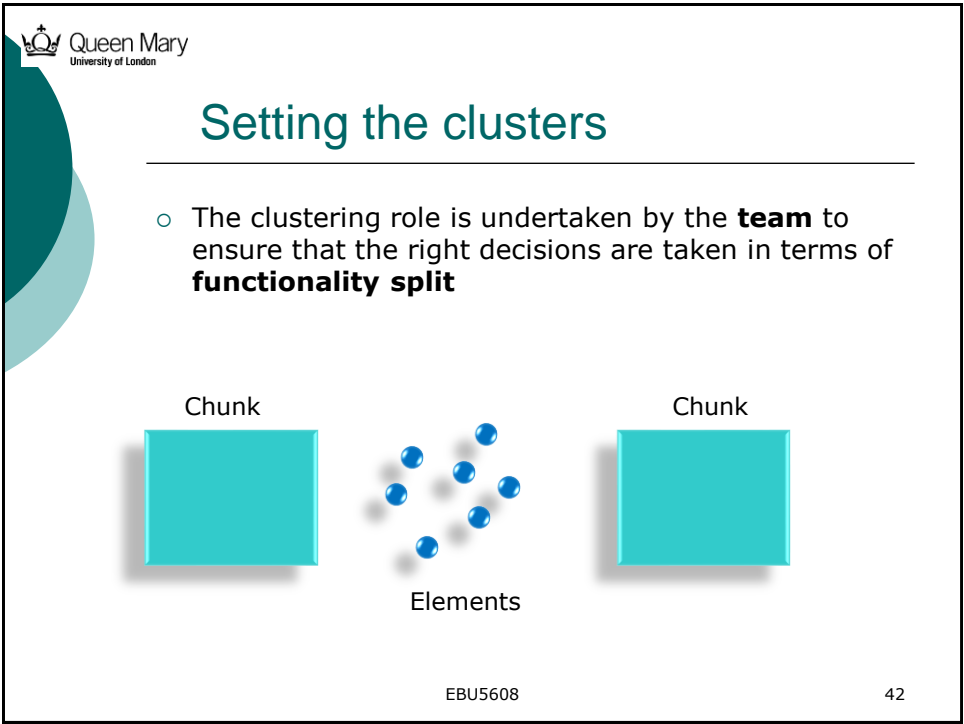

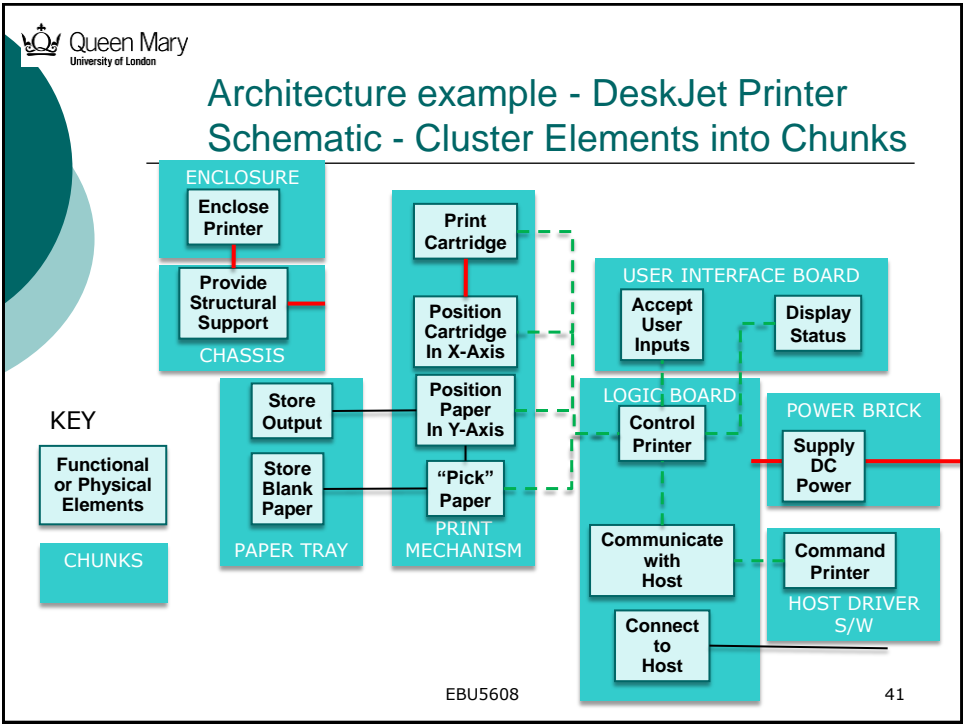

Step 2 – Cluster the elements of the schematic

- This step requires **assigning** and/or **clustering** each of the **elements** of the schematic to a **chunk**
- An **example** of this clustering can be seen in the next slide

EBU5608 40

Setting the clusters

- When deciding where to set the clusters, the following factors should be considered:
- **Geometric integration and precision**
 - Assigning elements to the **same** chunk allows a **single** individual or group to control the physical **relationships** among the elements
 - Elements requiring **precise location** or **close geometric integration** can often be best designed if they are part of the **same** chunk
 - e.g. paper handling in a printer

EBU5608

43

43

Setting the clusters

- **Function sharing**
 - When a **single** physical **component** can implement **several functional** elements of the product, these functional elements are best clustered **together**
 - For example, an integrated control panel on a car

EBU5608

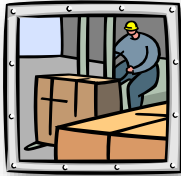

44

44

Setting the clusters

- **Capabilities of vendors**
 - A **trusted vendor** may have specific capabilities related to a project
 - To best take advantage of such capabilities a team may choose to cluster those elements about which the vendor has **expertise** into **one chunk**

EBU5608

45

Setting the clusters

- **Similarity of design or production technology**
 - When **two or more** functional elements are likely to be implemented using the **same design** and/or **production technology**, then incorporating these elements into the **same chunk** may allow for more economical design and/or production
 - A common strategy, for example, is to **combine** all functions that are likely to involve **electronics** in the **same chunk**. This allows the possibility of implementing all of these functions within a **single circuit board**

EBU5608

46

Setting the clusters

- **Localisation of change**
 - When a team expects there to be a **great deal of change** in an element, it makes sense to **isolate** that element into its own modular chunk
 - In that way, any necessary changes to the element can be carried out without **disrupting** any of the other chunks

EBU5608

47

47

Setting the clusters

- **Accommodating variety**
 - Elements should be clustered together to enable the firm to **vary** the product in ways that will have value for **customers**
 - Example – a power supply needs to handle different mains supplies in different countries

230V 50Hz

120V 60Hz

100V 60Hz

120V 50Hz

EBU5608

48

48

Setting the clusters

- **Enabling standardisation**
 - If a set of elements will be useful in **other products**, they should be clustered together into a single chunk
 - This allows the **physical elements** of the chunk to be produced in **higher quantities**
 - Example – cartridge in ink jet printer

EBU5608

49

Step 3 - Create a rough geometric layout

- A geometric layout can be created in **2 or 3 dimensions** or as **physical** models
 - an example can be found on a later slide
- Creating a geometric layout forces the team to consider
 - whether the **geometric interfaces** among the chunks are **feasible** and
 - to work out the basic **dimensional relationships** among the chunks

EBU5608

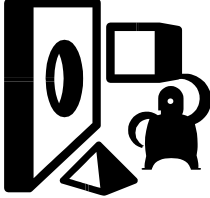

50

Queen Mary
University of London

Step 3 - Create a rough geometric layout

- In some cases, the team may discover that the clustering derived in step 2 is **not** geometrically feasible
- If this happens, some of the elements have to be **reassigned** to other chunks

EBU5608

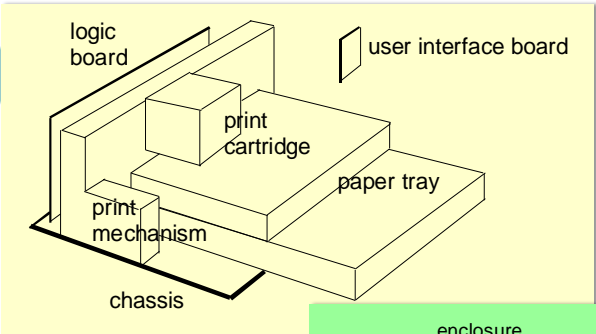

51

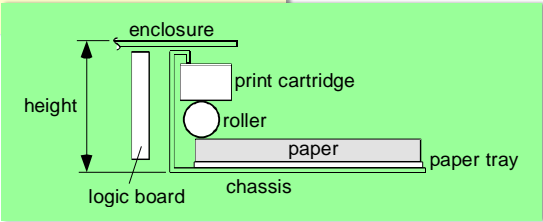

51

Queen Mary
University of London

Geometric Layout Example

EBU5608

52

52

Queen Mary
University of London

Step 4 - Identify the fundamental and incidental interactions

- It is most likely that a **different** person or group will be assigned to design **each chunk**
- Because the chunks interact with one another in both **planned** and **unintended** ways, these different groups will have to **coordinate** their activities and exchange information
- To **manage** this coordination process better, the team should **identify** the known **interactions** between chunks during the system-level design phase

EBU5608

53

Queen Mary
University of London

Step 4 - Identify the fundamental and incidental interactions

- There are two categories of interaction
 - **Fundamental**
 - Those which correspond to the lines on the **schematic** that **connect** the chunks to one another
 - These are the **fundamental** interactions of the systems operation

EBU5608

54

Queen Mary
University of London

Step 4 - Identify the fundamental and incidental interactions

- Incidental
 - Those that arise because of
 - the particular physical implementation of functional elements, or
 - because of the geometric arrangement of the chunks
 - An **incidental interaction graph** is used to document this type of interaction, see next slide

EBU5608

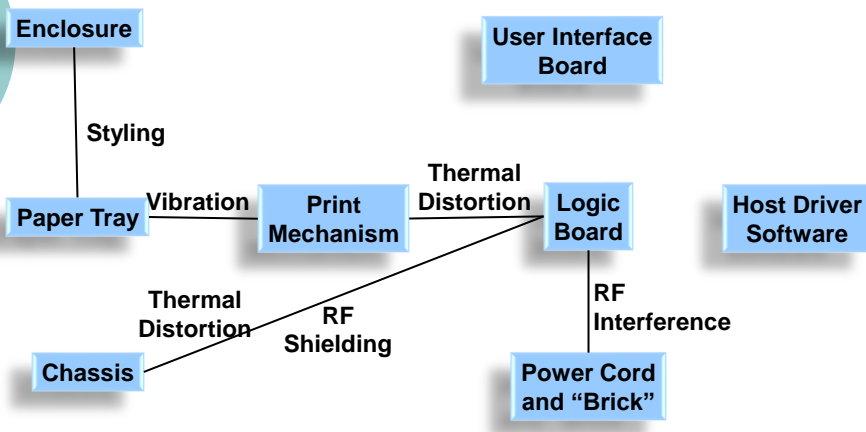

55

55

Queen Mary
University of London

Incidental interactions example

The diagram illustrates incidental interactions between various components of a system. The components are represented as blue boxes: Enclosure, User Interface Board, Paper Tray, Print Mechanism, Logic Board, Host Driver Software, Chassis, and Power Cord and "Brick". The interactions are as follows: Enclosure to Paper Tray (Styling); Paper Tray to Print Mechanism (Vibration); Print Mechanism to Logic Board (Thermal Distortion); Chassis to Logic Board (Thermal Distortion and RF Shielding); Logic Board to Power Cord and "Brick" (RF Interference); and Host Driver Software to Logic Board.

EBU5608

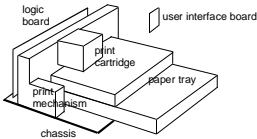

56

56

Key Outcomes

- The **end results** of this 4-step method for establishing the product architecture are:
 - an approximate **geometric layout** of the product
 - **descriptions** of the major chunks
 - documentation of the key **interactions** among the chunks

EBU5608

57

Summary

- **4-step method** for establishing the product architecture
 - Step 1 – Create a **schematic** of the product
 - Step 2 – **Cluster** the elements of the schematic
 - Step 3 - Create a rough **geometric layout**
 - Step 4 – Identify the fundamental and incidental **interactions**

EBU5608

58

In-class Exercise (15 mins):

- 1. Name 3 different types of modular design in a PC.
- 2. From system-level design perspective, explain the 3 major differences between Apple keyboard design 1983 and that of 2024.

EBU5608
