How to download packet tracer software

This became a little more complicated this year so this guide tells you how to download the software. You can try downloading packet tracer from other places on the web but you will still need an account so it won't help much and some versions from the web simply crash or are the wrong version. You will need your own account. If you share accounts with someone else there is a danger you would be logged out or unable to access the system at a critical moment (like during an exam).

First create an account on skillsforall.

1) Browse to https://skillsforall.com/topics/cisco-packet-tracer

2) Scroll down to "Getting started with Cicso Packet Tracer" click on this and on "Get Started"

3) You will be taken to a login page where you need "Don't have an account?" Sign up

You will need to use your real email address as it will email you some log in information. Remember the password as you will need it later to log into packet tracer.

Once you have created an account you should be returned to the skills for all page https://skillsforall.com/launch?id=9762b32d-0a49-4d7a-b881-498eb3be42cc

4) Look for 1.0 Install Cisco Packet Tracer. You can also go to https://skillsforall.com/resources/lab-downloads

5) Currently Cisco provides version 8.2.0. This is slightly different from the one used in the classrooms but most principles will be the same (there is Linux or Windows 64 bit or Windows 32 bit).

Install packet tracer in the usual way. Once you run it it will ask you for a username and password – use the skillsforall username and password. (Please create your own don't use other students' usernames as it may cause problems.)
